(54) Title: EXPRESSION VECTORS COMPRISING THE MCMV IE2 PROMOTER

(57) Abstract: The invention relates to an expression vector comprising the promoter of the mCMV-IE2 gene, or a functional expression promoting fragment thereof, and/or an enhancer of the mCMV-IE2 gene, or a functional expression enhancing fragment thereof, wherein the expression vector does not contain any complete gene of the mCMV.

WO 2004/081167 A2

EXPRESSION VECTORS COMPRISING THE MCMV IE2 PROMOTER**FIELD OF THE INVENTION**

The invention relates to expression vectors comprising the promoter of the
5 mCMV-IE2 gene, or a functional expression promoting fragment thereof, and/or an
enhancer of the mCMV-IE2 gene, or a functional expression enhancing fragment
thereof, wherein the expression vector does not contain any complete gene of the
mCMV, to host cells containing such vectors, to methods of producing desired
polypeptides by using these expression vectors, and to uses of said expression vectors.
10 Expression vectors comprising the mCMV IE2 promoter and the mCMV IE1
promoter, optionally together with the new mCMV IE2 enhancer, are preferred in
accordance with the invention, particularly if both promoters are arranged in a bi-
directional architecture.

15 BACKGROUND OF THE INVENTION

Since decades, expression vectors have been used as vehicles for the
expression of genes or cDNAs encoding polypeptides or proteins of interest in host cells.
Strong viral or cellular promoters and enhancers are being used to express the gene of
interest at high levels by using transient or stable transfection of recombinant DNA into
20 the host cells. The immediate early (IE) region of the human cytomegalovirus (hCMV)
has been shown to be particularly suitable in this regard, and expression vectors
comprising gene elements derived from this region are known e.g. from EP0323997B1.

Until today, the gene regulatory sequences from the murine cytomegalovirus
(mCMV) have been used rarely, although mCMV derived regulatory elements were
25 identified to be very powerful and even stronger than the human counterpart (Kim et al.
2002).

US 4,963,481 (de Villiers) discloses expression vectors having a DNA encoding a
heterologous protein under the transcriptional control of DNA fragments derived from the
mCMV IE gene region including an approximately 2270 base pair (bp) restriction
30 endonuclease PstI fragment isolated from the viral genome. A 1387 bp truncated version
of this fragment resulted in significant improvement in the efficacy of the DNA fragment
as a promoter for expression of the heterologous protein.

US 4,968,615 (Kozinowski) describes recombinant DNA molecules containing
transcription enhancers from murine cytomegalovirus (MCMV) which can be used to

enhance the transcription of structural genes in eukaryotic cells. The mCMV enhancer was said to be located within the 2.27 kb PstI fragment identified by de Villiers (US 4,963,481).

Manning and Mocarski (1988) analysed the functional importance of the mCMV IE2 region for replication of the murine cytomegalovirus. To this end, a recombinant virus was constructed having the lacZ reporter gene under the transcriptional control of the mCMV IE enhancer/promoter, thus disrupting the IE2 gene. Indeed no IE2 gene expression could be observed, and the virus replicated normally. The authors thus concluded that the IE2 gene, that is not conserved among the cytomegaloviruses such as the mCMV and the hCMV, was not essential for virus replication. No indication of any particular utility of the IE2 enhancer/promoter region was disclosed or suggested by Manning and Mocarski.

More recent literature shows a further difference between the mouse and human CMV IE region. The mouse locus expresses a second major mRNA in the opposite direction of the first IE gene. This second immediate early gene was termed IE2, and its promoter sequence referred to as IE2 promoter (Messerle et al. 1991).

The IE2 region from the mCMV has not been used in vectors for expression of heterologous proteins so far.

20 SUMMARY OF THE INVENTION

The present invention is based on the finding that a vector having a DNA element comprising the IE2 promoter region of the mCMV can efficiently drive the expression of a gene of interest in transfected host cells.

The invention is further based on the identification of a new enhancer in the mCMV IE2 region, which is herein called the mCMV IE2 enhancer. This enhancer fulfills the criteria commonly applied for enhancer definition, i.e. enhancing expression independently from (1) location, (2) orientation, and (3) enhancing the expression from a heterologous promoter.

30 Therefore, a first aspect of the invention relates to an expression vector comprising the promoter of the mCMV-IE2 gene, or a functional expression promoting fragment thereof, and/or an enhancer of the mCMV-IE2 gene, or a functional expression enhancing fragment thereof, wherein the expression vector does not contain any complete gene of the mCMV.

In a second aspect, the invention relates to a host cell comprising a vector according to the invention.

A third aspect of the invention relates to a process for the production of a polypeptide of interest comprising the step of transfecting a host cell with a vector in accordance with the invention.

In a fourth aspect, the invention relates to a process for the production of a polypeptide of interest comprising the step of culturing the host cell of the invention.

A fifth aspect of the invention relates to the use of a vector in accordance with the invention for expression of one or more genes or cDNAs of interest.

In a sixth aspect, the invention relates to the use of a vector of the invention for selection of clones that express high amounts of a gene of interest.

A seventh aspect relates to the use of a vector in accordance with the present invention in DNA-based therapy.

BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 shows the sequence of a bi-directional DNA element derived from the mCMV IE region for use in expression constructs. The +1 sites and TATA boxes of the IE2 and IE1 promoters are indicated, respectively. The core promoters for both genes are shown in a box. HpaI and XhoI restriction sites are shown in bold. The -682 position is indicated with respect to +1 of IE1.

Fig. 2 shows the reporter constructs A to G. The luciferase reporter gene is shown as a bold line and promoters are indicated as open arrows.

- A: The negative promoter-less control (pGL3 Basic).
- B: An SV40 promoter/enhancer driven luciferase reporter vector (pGL3 Control).
- C: Luciferase expression IE1 promoter driven (pmCMV Luciferase, IE1 driven).
- D: Luciferase expression IE2 promoter driven (prevmCMV Luciferase, IE2 driven).
- E: Luciferase expression IE2 promoter driven, IE1 promoter deleted (prevmCMV Luciferase (Δ XhoI), IE2 driven, IE1 minus).
- F: Luciferase expression IE1 promoter driven, and IE2 promoter deleted (pBS.MCMV3 Luciferase, IE1 driven (1.4 kb), IE2 minus).
- G: A short version of the IE1 promoter drives Luciferase expression (p-680 Luciferase, IE1 driven (short version, 0.68 kb)).

Fig. 3 shows a bi-directional construct similar to construct C of Fig. 2 (construct C-2) with the coding sequence for IL-18BP (bold line) linked to the IE2 promoter. Thus, in this construct, the mCMV IE1 promoter drives luciferase expression, and simultaneously the mCMV IE2 promoter drives IL-18BP expression. Triangle: intron. Closed ovals: polyA.

Fig. 4 shows the Luciferase reporter gene expression from the different reporter constructs that are depicted in Fig. 2, constructs A to G. CHO-S cells grown in a serum-free medium (SFM) were transiently transfected with constructs A to G, or mock transfected. Luciferase activity is expressed as RLU = relative light units.

Fig. 5 shows Luciferase expression measured as RLU in stable pools of transfected CHO-S cells. The cells were grown in SFM after transfection with constructs D, C, F and E, as depicted in Fig. 2. Luciferase expression was assessed after 21 days of selection.

Fig. 6 shows Luciferase expression measured as RLU after transient transfection with 900, 500, 300 and 100 ng of the bi-directional construct C-2 shown in Fig. 3.

Fig. 7 shows the amount of IL-18BP in ng/l in the cell culture supernatants from the transient transfection experiment according to Fig. 6 (construct C-2).

Fig. 8 shows the ratio of the amounts of IL-18BP versus Luciferase measured in the experiment according to Figs. 6 and 7.

Fig. 9 shows the amounts of Luciferase in RLU (left y axis) and IL-18 BP in ng/ml (right y axis) expressed by 48 individual clones that were picked 8 days after transfection with the bi-directional construct C-2 (as shown in Fig. 3). The detection limit for Luciferase was about 500 RLU, and 2.5 ng/ml for IL-18BP. Each increment on the X axis represents one single clone.

Fig. 10 (a) shows the reporter constructs H to N. The luciferase reporter gene (Luc) is shown as a bold line and the respective IE1 and IE2 promoters are indicated as

open arrows. Enhancers are shown as gray ovals: Light gray for the known IE1 enhancer, and dark gray for the new IE2 enhancer.

H: Bidirectional construct with IE2 promoter driven Luciferase expression;

I: Luciferase expression was IE2 promoter driven, and the IE1 promoter was
5 deleted;

J, K, L, M, N: constructs contained shortened mCMV promoters, the positions
corresponding to the number of base pairs from mCMVp, relative to the +1 of
IE2 as reference:

J: from - 1076

10 K: from - 783

L: from - 587

M: from - 387

N: from -189

15 Fig. 10 (b) shows Luciferase expression in RLU from reporter constructs H to N according to Fig. 10 (a), after transient transfection of CHO-S cells that were grown in a serum-free medium.

Fig. 11 (a) shows further reporter constructs O to Y that combined the new IE2 enhancer
20 (gray oval) with the SV40 promoter. The gray oval represents the IE2 enhancer from -587 to -189, the half gray oval represents the IE2 enhancer from -387 to -189. The arrow above the IE2 enhancer indicates the direction of the enhancer sequence. The luciferase reporter gene is shown as a bold line, the SV40 promoter is indicated as an open arrow. Black oval: polyA.

25 O: long IE2 enhancer sequence (-587/-189) cloned 5' of SV40 promoter;

P: short IE2 enhancer sequence (-387/-189) cloned 5' of SV40 promoter;

Q: long IE2 enhancer sequence (-587/-189) cloned 5' of SV40 promoter in the
reverse orientation;

30 R: short IE2 enhancer sequence (-387/-189) cloned 5' of SV40 promoter in the
reverse orientation;

S: long IE2 enhancer sequence (-587/-189) cloned 3' of the Luciferase gene;

T: short IE2 enhancer sequence (-387/-189) cloned 3' of the Luciferase gene;

U: long IE2 enhancer sequence (-587/-189) cloned 3' of the Luciferase gene in
the reverse orientation;

V: short IE2 enhancer sequence (-387/-189) cloned 3' of the Luciferase gene in the reverse orientation;

W: Control, SV40 promoter and SV40 enhancer in 3' of the Luciferase coding sequence

5 X: Control, Luciferase expression driven by SV40 promoter without any enhancer

Y: negative control, no promoter at all.

Fig. 11 (b) shows Luciferase expression from reporter constructs O to Y as shown in Fig.

11 (a). CHO-S cells grown in a serum-free medium (SFM) were transiently transfected with constructs O to Y. Luciferase activity is expressed as fold induction as compared to the control X (value 1), i.e. expression driven by the SV40 promoter without any enhancer. Open bars: long IE2 enhancer (-587 to -189), hatched bars: short IE2 enhancer (-387 to -189). X axis is a logarithmic scale.

15

Fig. 12 shows an experiment comparing the new IE2 enhancer with the known hCMV enhancer. Cells were transfected with control construct A (pGL3 basic, see Fig. 2, promoterless), control construct B (pGL3 ctrl, see Fig. 2, SV40 promoter with the SV40 enhancer sequence in 3' of the luciferase coding region), control construct X (SV-Luc+, see Fig. 11.a, SV40 promoter without enhancer), as well as constructs O and Q (see Fig. 11 a) or constructs O-2 and Q-2, in which the IE2 enhancer sequence (long version, -587 to -189) was replaced by the known hCMV enhancer sequence (SEQ ID NO: 2). Luciferase were measured in RLU (x axis). Hatched bars: with known hCMV enhancer. Gray bars: with new IE2 enhancer.

20

25

Fig. 13 shows the bi-directional vector used for simultaneous expression of IL-18BP and Luciferase. IE1 and IE2 promoters are indicated as open arrows. The triangle represents intron A from the hCMV IE region, and the gray oval the polyadenylation signal. The closed square represents the signal peptide.

30

Construct #26: Luciferase expressed from IE1 promoter and IL-18BP from IE2 promoter. The sequence between both promoters is as in construct H of Fig 10.a.

Construct #140: Luciferase expressed by IE2 promoter and IL-18BP from IE1 promoter. The IE2 enhancer (- 587 to -189) is located between the two promoters.

- 5 Fig 14 shows the amounts of expressed Luciferase (RLU, left y axis) and IL-18BP (ng/ml, right Y axis) after transient transfection of CHO cells grown in serum-free medium with either construct #26 or #140 according to Fig. 13. Bars: Luciferase expression, closed lozenges: IL-18BP expression.
- 10 Fig 15 shows expression of luciferase (RLU, left y axis) and IL-18BP (ng/ml, right y axis) in stable pools transfected with either construct #26 or #140 according to Fig. 13. Expression was measured 7 weeks post-transfection. The cells were kept under selection with puromycin (+ puro), or for 3 weeks without puromycin selection (- puro). Bars: Luciferase expression, closed lozenges: IL-18BP expression.
- 15 Fig 16 shows the time course of Luciferase expression as in experiment of Fig. 15. The x axis represents time in weeks. The data shown in Fig. 15 correspond to the 3 weeks date in Fig. 16. Closed lozenge: #26 + puro, small square: #140 + puro, closed triangle: #26 – puro, large square: #140 – puro.
- 20 Fig 17: shows time course of IL-18BP expression in the experiment according to Fig. 16. legend as in Fig. 16.
- 25 Fig 18 Individual proto-clones were analyzed for luciferase expression (squares) in RLU (left y axis) and IL-18BP expression (lozenges) in ng/ml (right y axis). Each increment on the x axis represents an individual proto-clone. Protoclones were established from CHO cells stably transfected with construct #26 and were kept under puromycin selection.
- 30 Fig 19: As Fig. 18, but protoclones were established from cells transfected with construct #140.
- Fig. 20: The protoclones transfected either with construct #26 or #140 were analyzed for Luciferase expression in a 96 well format, inverted ChemiDoc view.

DETAILED DESCRIPTION OF THE INVENTION

In accordance with the present invention, it has been surprisingly found that the promoter of the immediate early two (IE2) gene of the murine cytomegalovirus (mCMV) is efficient in promoting the expression of a polypeptide of interest that is not the mCMV IE2 protein itself, i.e. of a heterologous polypeptide or protein. This expression vector is not supposed to be the murine cytomegalovirus itself, or contain any complete mCMV viral genes, but it is a vector conceived for recombinant protein expression.

Therefore, the invention relates to an expression vector comprising the promoter of the mCMV-IE2 gene, or a functional expression promoting fragment thereof, wherein the expression vector does not contain any complete gene of the mCMV.

In addition to this, a new enhancer has been identified in the mCMV IE2 region, which is called herein the mCMV IE2 enhancer, or the IE2 enhancer. This enhancer enhances expression irrespective of its location or orientation vis-à-vis the gene, and enhances expression from heterologous promoters, thus fulfilling the general criteria of an enhancer.

The invention therefore also relates to an expression vector comprising the enhancer of the mCMV-IE2 gene, or a functional expression enhancing fragment thereof, wherein the expression vector does not contain any complete gene of the mCMV.

The person skilled in the art will appreciate that the vector of the invention may comprise the mCMV IE2 promoter alone, or in combination with any appropriate known enhancer. The person skilled in the art will also appreciate that the vector of the invention may comprise the mCMV IE2 enhancer alone, or in combination with any suitable promoter. In addition, the vector of the invention may comprise the mCMV IE2 promoter in combination with the mCMV IE2 enhancer.

The mCMV IE2 gene itself is known e.g. from Messerle et al., 1991.

The term "promoter" as used herein refers to a region of DNA that functions to control the transcription of one or more DNA sequences, and that is structurally identified by the presence of a binding site for DNA-dependent RNA-polymerase and of other DNA sequences, which interact to regulate promoter function. A functional expression promoting fragment of a promoter is a shortened or truncated promoter sequence retaining the activity as a promoter. Promoter activity may be measured in any of the assays known in the art, e.g. in a reporter assay using Luciferase as reporter

gene (Wood, 1991; Seliger and McElroy, 1960; de Wet et al. (1985), or commercially available from Promega®).

In accordance with the present invention, the IE2 promoter may e.g. comprise a sequence spanning from position +1 to the TATA box as indicated in Fig. 1. The IE2 promoter may also comprise a sequence herein called "core promoter" spanning from nucleotide 1 to 39 of the sequence depicted in Fig. 1 (box). The person skilled in the art will appreciate that the sequence of the mCMV IE2 promoter may be longer or shorter than the core promoter, as long as it drives transcription of a DNA sequence operably linked thereto. For instance, the IE2 promoter may also comprise 100-200 base pairs upstream of the core promoter. Such promoter region is also called the "proximal promoter". The person skilled in the art will further appreciate that the terms "promoter" and "enhancer" (see below) are not exactly defined and that thus the promoter may comprise enhancer regions, or enhancer regions may comprise promoter regions, depending on nomenclature and context.

The term "vector" refers to any carrier of exogenous DNA or RNA that is useful for transferring exogenous DNA to a host cell for replication and/or appropriate expression of the exogenous DNA by the host cell.

The term "operably linked" as used herein means functionally fusing a promoter with a structural gene or cDNA or any other DNA sequence to be transcribed in the proper frame to express the gene, cDNA or other DNA under control of the promoter. The term operably linked, as used herein, is thus not limited to a direct fusion of DNA sequences.

The term "complete gene of the mCMV" refers to a viral gene of the murine cytomegalovirus that has its own (endogenous, viral) 5' and 3' regulation elements.

An "enhancer region" refers to a region of DNA that functions to increase the transcription of one or more genes. More specifically, the term "enhancer", as used herein, is a DNA regulatory element that enhances, augments, improves, or ameliorates expression of a gene irrespective of its location and orientation vis-à-vis the gene to be expressed, and may be enhancing, augmenting, improving, or ameliorating expression of more than one promoter. Preferably, the enhancer enhances expression from more than one promoter simultaneously. A functional expression enhancing fragment of an enhancer is a shortened or truncated enhancer sequence retaining the enhancing activity.

The vector of the invention preferably comprises a fragment including nucleotides –387 to –189 of the mCMV IE2 upstream region, the nucleotide numbering being relative to +1 of IE2 gene. This fragment has enhancer function, and it is herein also called IE2 enhancer short version.

5 In a further preferred embodiment, the vector comprises a fragment including nucleotides –587 to –189 of the mCMV IE2 upstream region, the nucleotide numbering being relative to +1 of IE2 gene. This fragment has enhancer function, and it is herein also called IE2 enhancer long version.

The vector of the invention may also comprise yet a further mCMV IE enhancer, or a functional expression enhancing fragment thereof, herein called the “CMV IE1 enhancer”.

Such an mCMV IE1 enhancer is known in the art, e.g. from US 4,968,615. It may e.g. span from position –587 to –147, or from position –682 to –147 of the sequence shown in Fig. 1, the numbering being relative to +1 position of the IE1 gene.

15 The mCMV IE1 enhancer that may be used in accordance with the present invention may further comprise a sequence spanning from base pair –1330 to –488, relative to position +1 of the IE1 in Fig. 1. The enhancer region may comprise all or part of a promoter as well.

By using a mCMV enhancer in addition to the IE2 promoter, expression of the polypeptide of interest may further be increased.

In accordance with the present invention, the vector further comprises a promoter that is different from the mCMV-IE2 promoter, or a functional expression promoting fragment thereof.

25 In a preferred embodiment, the vector of the invention comprises a first and a second promoter of viral, cellular or artificial origin, or a functional expression promoting fragment thereof.

In accordance with the present invention, it has been shown that the presence of a second promoter leads to efficient expression of a polypeptide of interest from the mCMV IE2 promoter. Therefore, in a preferred embodiment, the vector comprises the mCMV IE2 promoter in combination with a second promoter, or a functional expression promoting fragment thereof. Examples for further suitable promoters include the hCMV promoter, the metallothionein promoter (MT), the SV40 promoter, or artificial promoter.

30 Preferably, the second promoter is a further copy of the mCMV IE2 promoter. Such

further promoters may promote constitutive or regulated expression. Regulated expression may be inducible or repressible expression, or both.

Preferably, such second promoter is the promoter of the mCMV-IE1 gene, or a functional expression promoting fragment thereof. It is thus particularly preferred that the first promoter is the mCMV-IE2 promoter, or a functional expression promoting fragment thereof, and the second promoter is the mCMV-IE1 promoter, or a functional expression promoting fragment thereof.

The mCMV-IE1 promoter is known e.g. from WO 87/03905. It may comprise the core promoter containing the last 47 bp of the sequence of Fig. 1 (box), or additional 100 to 200 bp upstream sequences (i.e. the proximal promoter), or it may comprise the whole intergenic region up to position -1330 (relative to position +1 of the IE1, see Fig. 1).

In a preferred embodiment, the vector comprises a DNA sequence of SEQ ID NO: 1, including both the IE1 and the IE2 promoter as well as the IE 1 enhancer and the new IE2 enhancer, or any functional expression promoting fragment thereof.

In a highly preferred embodiment, in the vector according to the invention, the promoter, or a functional expression promoting fragment thereof, is operably linked to a DNA sequence coding for at least one polypeptide. In a further embodiment of the invention, the enhancer of the invention is present on the expression vector together with a DNA sequence coding for at least one polypeptide.

Preferably, the DNA sequence codes for a protein of interest.

It is further preferred that the DNA sequence codes for a marker protein, or is an amplifiable gene.

It is also preferred that the DNA sequence codes for a reporter protein.

Should the vector of the invention contain more than one promoter, any combination or sub-combination of protein of interest, marker, reporter, amplifiable gene, etc., may be expressed from the same plasmid,

In accordance with the present invention, the polypeptide of interest may be any polypeptide which different from the IE2 polypeptide itself, be it an extracellular protein such as peptide hormones, cytokines or growth factors, or a transmembrane protein such as growth factor receptors or hormone receptors, or intracellular proteins such as kinases, phosphatases or DNA binding proteins, depending on the intended use of the polypeptide of interest or host cell in which it is expressed.

Marker proteins suitable in accordance with the present invention are e.g. negative or positive selection markers, or amplifiable genes. Examples include proteins selected from adenosine deaminase (ADA), aminoglycoside phosphotransferase (neo), dihydrofolate reductase (DHFR), hygromycin-B-phosphotransferase (HPH), thymidine kinase (tk), xanthine-guanine phosphoribosyltransferase (gpt), multiple drug resistance gene (MDR), ornithine decarboxylase (ODC) and N-(phosphonacetyl)-L-aspartate resistance (CAD), or puromycin acetyltransferase (PAC). Further examples include genes used for selection by use of particular metabolic pathways such as galactokinase (Schumperli et al., 1982), the folate receptor (Zhu et al., 2001), or reduced folate carrier (Assaraf et al., 1992).

In yet a further preferred embodiment the polypeptide of interest is a reporter gene.

The term "reporter gene" or "reporter protein", as used herein, is intended to mean a gene encoding a gene product that can be identified using simple, inexpensive methods or reagents, and that can be operably linked to a promoter region of the invention or an active fragment thereof. Reporter genes may be used to determine transcriptional activity in screening assays (see, for example, Goeddel (ed.), *Methods Enzymol.*, Vol. 185, San Diego. Academic Press, Inc. (1990)), e.g. using Luciferase as reporter gene (Wood, 1991; Seliger and McElroy, 1960; de Wet et al. (1985), or commercially available from Promega®).

Examples are selected from luciferase, green fluorescent protein, alkaline phosphates, O-galactosidase, or horseradish peroxidase or intramolecular combinations with other proteins, such as e.g. the Green Fluorescent Protein (GFP) or enhanced GFP (EGFP) with the puromycin acetyltransferase gene (Abbate et al., 2001), or combinations thereof.

Experimental data the present invention is based on showed that efficient simultaneous expression of polypeptides of interest may be achieved from the IE2 and IE1 promoter, both present on the same plasmid. Therefore, in a further preferred embodiment, both the mCMV IE2 promoter, and the mCMV-IE1 promoter, or the functional expression promoting fragments thereof, are operably linked to a polypeptide, respectively.

High expression levels may be achieved if both promoters are present in a bi-directional architecture. Therefore, the mCMV-IE2 promoter, or functional expression

promoting fragment thereof, and a promoter, in particular the mCMV-IE1 promoter, or a functional expression promoting fragment thereof, are bi-directionally arranged.

The term "bi-directionally arranged", as used herein, is intended to mean that the promoters drive transcription in opposite directions. This arrangement of the plasmid DNA is also referred to as a "bi-directional architecture" of the vector.

The promoters of the mCMV-IE1 or mCMV-IE2 gene, or the functional expression promoting fragments thereof, or any further promoter that may be used in combination with the mCMV-IE2 promoter, or in combination with the IE2 enhancer, may further include a translation initiation signal.

In a further preferred embodiment, the promoter of the mCMV-IE2 gene, or a functional expression promoting fragment thereof, or the mCMV IE2 enhancer, is linked to other elements regulating or influencing transcription. Such elements may affect processing, stability or translation efficiency of RNA. Examples for suitable elements are selected from the group consisting of 5'UTRs, introns, 3'UTRs (see e.g. Mazumder et al, 2003), mRNA 3' end processing sequences (e.g. polyadenylation sites), and IRES sequences for polycistronic expression (see e.g. Mountford and Smith, 1995).

It is preferred to use an IRES element for expression of polycistronic mRNAs, in which the coding sequences are separated by the IRES. The advantage is that several polypeptides of interest may be expressed from the same mRNA and thus from the same promoter.

In yet a further preferred embodiment, the promoter of the mCMV-IE2 gene alone, or in combination with the promoter of the mCMV IE1 gene, or any other natural or artificial promoter, or the IE2 enhancer, may be linked to further expression promoting sequences such as insulators, boundary elements, LCRs (e.g. described by Blackwood and Kadonga (1998)) or matrix/scaffold attachment regions (e.g. described by Li et al., 1999).

The person skilled in the art may appreciate that the vector of the present invention may also contain further enhancers, such as e.g. the well known SV40 enhancer or the hCMV enhancer.

In accordance with the present invention, the polypeptide operably linked to a first promoter, preferably the mCMV IE 2 promoter, and the polypeptide operably linked to a second promoter, preferably the mCMV IE1 promoter, may be the same. In this case, two copies of the same gene are present on the same vector, but under the control of two different promoters. Thus, it may be possible to achieve an expression

rate superior to expression from a single copy of a gene encoding a polypeptide of interest.

In an alternative embodiment, the polypeptide operably linked to a first promoter, preferably the mCMV IE2 promoter, and the polypeptide operably linked to a second promoter, preferably the mCMV IE1 promoter, are different. The invention thus provides for an efficient vector for co-expression of two different polypeptides, such as selection markers and proteins of interest, co-expression of two or more subunits of the same protein, or even of different domains of the same protein, should it be desirable to express them separately from each other, but in the same host cell.

The person skilled in the art will appreciate that several expression vectors in accordance with the present invention may be co-transfected into the same cell and serve for expression of multiple proteins and/or subunits of quite complex multimeric proteins.

It is preferred that the polypeptide operably linked to a first promoter, e.g. the mCMV IE2 promoter, is a first subunit of a dimeric or multimeric protein and the polypeptide operably linked to a second promoter, preferably the mCMV IE1 promoter, is a second subunit of a dimeric or multimeric protein. Co-expression of the two subunits of a dimeric protein is preferred in accordance with the present invention. Co-expression of two subunits of the same protein is particularly advantageous since expression from both promoters may result in production of similar amounts of subunits, or of predetermined ratios of both polypeptides, depending on the strength of the promoters used. The subunits may then assemble in the same cell to form a mature protein.

Preferred examples for dimeric proteins suitable to be expressed using a vector of the invention are the alpha-chain and the beta-chain of a peptide hormone such as human FSH, human LH, human TSH and human CG. Either of the two subunits may be linked to a promoter in accordance with the invention, preferably the mCMV IE2 promoter. The person skilled in the art will appreciate that hormones from other species may be equally used in accordance with the present invention, such as equine, porcine, bovine hormones, for instance, depending on the intended use of the recombinant polypeptide.

In another embodiment of the invention, the first subunit is the heavy chain, and the second subunit is the light chain of an immunoglobulin, or vice versa. A preferred example of a suitable immunoglobulin is an IgG. Such immunoglobulins may e.g. be

humanized or human antibodies for therapeutic use. A highly preferred example for such a humanized antibody is a humanized anti-CD11 antibody having the tradename Raptiva®.

Many polypeptides of interest may be expressed using a vector of the invention.

- 5 In preferred embodiments, the polypeptide is selected from the group consisting of chorionic gonadotropin, follicle-stimulating hormone, lutropin-choriogonadotropic hormone, thyroid stimulating hormone, human growth hormone, interferons (e.g., interferon beta-1a, interferon beta-1b), interferon receptors (e.g., interferon gamma receptor), TNF receptors p55 and p65, interleukins (e.g., interleukin-2, interleukin-11),
10 interleukin binding proteins (e.g., interleukin-18 binding protein), anti-CD11a antibodies, and muteins, fragments, soluble forms, functional derivatives, fusion proteins thereof.

- Other preferred polypeptides of interest include, e.g., erythropoietin, granulocyte colony stimulating factor, granulocyte-macrophage colony-stimulating factor, pituitary peptide hormones, menopausal gonadotropin, insulin-like growth factors (e.g.,
15 somatomedin-C), keratinocyte growth factor, glial cell line-derived neurotrophic factor, thrombomodulin, basic fibroblast growth factor, insulin, Factor VIII, somatropin, bone morphogenetic protein-2, platelet-derived growth factor, hirudin, epoietin, recombinant LFA-3/IgG1 fusion protein, glucocerebrosidase, and muteins, fragments, soluble forms, functional derivatives, fusion proteins thereof.

20

The second aspect of the invention relates to a host cell transfected with at least one vector described above. The skilled person will appreciate that the host cell may equally be co-transfected with two or more vectors in accordance with the present invention.

- 25 Many host cells are suitable in accordance with the present invention, such as primary or established cell lines from a wide variety of eukaryotes including plant and animal cells, mammalian or human cells. For example, suitable host cells include CHO cells, COS cells, CV1 cells, mouse L cells, HT1080 cells, BHK-21 cells, HEK293 cells, NIH-3T3 cells, LM cells, Y1 cells, NS0 and SP2/0 mouse hybridoma cells and the like,
30 Namalwa cells, RPMI-8226 cells, Vero cells, WI-38 cells, MRC-5 cells or other immortalized and/or transformed cells.

Preferably, the host cell is a CHO cell, and more preferably a CHO-S cell, described e.g. by Shotwell et al. (1982, J Biol. Chem. 257:2974-2980). CHO cells were

first cultured by Puck (J.Exp.Med. 108, 945, 1958) from a biopsy of an ovary from a female Chinese hamster. From these original cells a number of sub-lines were prepared with various characteristics. One of these CHO cell lines, CHO-K1, is proline-requiring and is diploid for the dihydrofolate reductase (DHFR) gene. Another line derived from this cell line is a DHFR deficient CHO cell line (CHO DUK B11) (PNAS 77, 1980, 4216-4220), which is characterized by the loss of DHFR function as a consequence of a mutation in one DHFR gene and the subsequent loss of the other gene.

All of these cells may be transfected with the vectors of the present invention, either transiently, or in a semi-stable (e.g., if vector is episomal) or stable (e.g. integrated into the genome) manner. Stable transfection is preferred in order to establish clones that continuously express the polypeptide of interest.

The IE2 promoter of the present invention, or the IE2 enhancer, may be used as regulatory elements in the frame of a technology called "Endogenous Gene Activation". The vector of the invention may comprise be introduced into the locus of the genome which is supposed to be activated by homologous recombination, thus operably linking the regulatory sequence (IE2 promoter and/or enhancer) with the gene of interest, the expression of which is required to be induced or enhanced. The technology is described e.g. in WO 91/09955.

In a third aspect, the invention relates to a process for the production of a polypeptide of interest comprising the step of transfecting a host cell with a vector according to the invention.

Depending on the nature of the polypeptide of interest, the process according to the invention leads to a secreted protein or polypeptide that may be harvested from the cell culture supernatant, or to a cell membrane protein or intracellular protein that may be isolated from the cells by known methods. The polypeptide produced in accordance with the present invention may serve any purpose, and preferably it is a therapeutic protein intended for administration to humans or animals.

Depending on the intended use, the cell itself having the polypeptide integrated may be the product of the process according to the invention. Such a cell may e.g. be used for cell-based therapy.

In a fourth aspect, the invention relates to a process for the production of a polypeptide of interest comprising the step of culturing a host cell in accordance with the invention.

5 In a preferred embodiment, the process further comprises the step of isolating the polypeptide of interest from the host cells or cell culture supernatant. This step is particularly advantageous and easy to carry out for secreted proteins that may be isolated simply from the cell culture supernatant. However, this step equally applies to isolating polypeptides from cellular membranes, or intracellular compartments, that may be isolated from host cells.

10 The process may be used in transient, stable, episomal or viral expression systems. As shown in the Examples below, the vector of the invention resulted in particularly strong expression of the desired protein if used in a stable expression system. Therefore, in a preferred embodiment the transfection is stable transfection.

15 In a fifth aspect, the vector according to the invention is used for expression of a gene of interest. Genes of interest may be e.g. the genes coding for any of the above-mentioned polypeptides of interest. The vector of the invention may also be used for expression of marker genes, reporter genes, amplifiable genes, or the like.

20 Preferably, the vector is used for simultaneous expression of two or more genes or cDNAs of interest. It may also be used for simultaneous expression of one gene of interest and one marker gene or reporter gene or amplifiable gene, or the like.

25 In the frame of the present invention, it has been surprisingly shown that a vector of the invention, in particular a vector comprising the IE2 promoter, the IE2 enhancer, and the IE1 promoter, resulted in the identification of clones that highly expressed a reporter gene and a gene of interest. Therefore, in a sixth aspect, the invention relates to the use of a vector according to the invention for selection of clones that express high amounts of a gene of interest.

30 In a seventh aspect, the invention relates to the use of a vector of the invention for the manufacture of a medicament for use in plasmid or DNA based therapy or gene therapy.

In an eighth aspect, the host cell of the invention is used for the manufacture of a medicament for cell-based therapy. Should the cell-based therapy be intended for human treatment, it is preferred that the host cell is a human cell or cell line, more preferably a cell or cell line derived from the patient that is to be treated.

5

Having now fully described this invention, it will be appreciated by those skilled in the art that the same can be performed within a wide range of equivalent parameters, concentrations and conditions without departing from the spirit and scope of the invention and without undue experimentation.

10 While this invention has been described in connection with specific embodiments thereof, it will be understood that it is capable of further modifications. This application is intended to cover any variations, uses or adaptations of the invention following, in general, the principles of the invention and including such departures from the present disclosure as come within known or customary practice within the art to which the invention pertains and
15 as may be applied to the essential features hereinbefore set forth as follows in the scope of the appended claims.

All references cited herein, including journal articles or abstracts, published or unpublished U.S. or foreign patent application, issued U.S. or foreign patents or any other references, are entirely incorporated by reference herein, including all data, tables, figures
20 and text presented in the cited references. Additionally, the entire contents of the references cited within the references cited herein are also entirely incorporated by reference.

Reference to known method steps, conventional methods steps, known methods or conventional methods is not any way an admission that any aspect, description or
25 embodiment of the present invention is disclosed, taught or suggested in the relevant art.

The foregoing description of the specific embodiments will so fully reveal the general nature of the invention that others can, by applying knowledge within the skill of the art (including the contents of the references cited herein), readily modify and/or adapt for various application such specific embodiments, without undue experimentation, without
30 departing from the general concept of the present invention. Therefore, such adaptations and modifications are intended to be within the meaning and range of equivalents of the disclosed embodiments, based on the teaching and guidance presented herein. It is to be understood that the phraseology or terminology herein is for the purpose of description and not of limitation, such that the terminology or phraseology of the present specification is to

be interpreted by the skilled artisan in light of the teachings and guidance presented herein, in combination with the knowledge of one of ordinary skill in the art.

EXAMPLES

5 EXAMPLE 1: Evaluation of expression vectors in transient transfections

Materials and Methods:

Materials

Cells: CHO-S, origin Gibco/ Invitrogen (Cat no 11619).

10 Plasmid DNAs constructed as depicted in Figs. 2 and 3 were isolated from overnight growing standard cultures with the Nucleobond PC 500 kit (Macherey-Nagel Cat. No 740 574) according to the manufacturer's protocol.

Transfection:

15 Lipofectamine (*Invitrogen, Cat No 18324-012*)

Format: 24 well plates.

Cells: CHO-S cells in exponential growth phase were passaged 24 h before transfection. To avoid a stationary phase at low cell density, the cells were diluted to 0.75×10^6 cells/ml. The total amount of cells to be transfected was 1.5×10^5 ,
20 resuspended in 100 μ l serum free medium SFM II (Invitrogen, Cat No 12052-114) per well, in 24 well plates.

Transfection mixes were as follows:

A) Lipofectamine: 2 μ l

25 SFM II Medium: 48 μ l

Total volume is 50 μ l

B) DNAs: 1 μ g (50 ng expression vector + 950 ng carrier plasmid, pBluescript II KS (+), Stratagene, cat. 212205-01

30 SFM II Medium: complement to 50 μ l.

Solutions A and B were mixed, and incubated for 30 min at room temperature.

This mix was added to the 100 μ l SFM II Medium containing 1.5×10^5 cells. The cells were placed back to the incubator and incubated for 37°C, 5% CO₂ for 3 hours.

Then, 400 µl SFM II Medium were added in order to dilute the Lipofectamine. Then, the cells were incubated for another 48 hours before sampling for analysis. All transfections were carried out in triplicate.

5 *Luciferase Measurement:*

The Bright-Glo Luciferase assay system from Promega, Cat No E2610 was used for Luciferase measurement according to the manufacturer's guidelines.

Briefly, the cell suspension was homogenized by pipetting up and down several times, and an aliquot of 50 µl was taken out and put it in a white 96 well plate (Nunc, Cat
10 no 236108). Then, 50 µl of reconstituted Bright-Glo Reagent was added and incubated for 5 min at room temperature. Light emission was measured on a Centro LB 960 luminometer (Berthold Technologies) during 5 seconds of acquisition time.

Results

15 The expression vector constructs that were used in a CHO-S cell based transient expression system are depicted in Fig. 2. In this series of experiments, Luciferase was used as a reporter gene for evaluation of gene expression. Vectors having either no promoter at all (construct A) or the SV40 promoter/enhancer (construct B), which is not highly active in CHO-S cells, were used as controls.

20

The results from transient transfection experiments with vectors A to G are shown in Fig. 4. In constructs C and F, Luciferase expression is driven by the IE1 promoter. Both constructs resulted in Luciferase expression. Construct C further contained the IE2 promoter arranged bidirectionally with regard to the IE1 promoter. This
25 bi-directional arrangement reduced the expression efficiency from the IE1 promoter, construct C, as compared to the use of IE1 promoter alone, construct F. A short version of 0.68 kb of the IE1 promoter (construct G) was less efficient than the longer version (construct F).

30 Irrespective of the presence or absence of a second promoter in the same construct, the IE2 promoter efficiently drove Luciferase expression (constructs D and E) and may thus be used as a promoter element in expression vectors for expression of polypeptides of interest.

In contrast to the IE1 promoter, the IE2 promoter was less efficient if used alone (construct E) than if used in a bi-directional architecture (construct D). It is therefore particularly suitable for use in bi-directional expression vectors.

5 **EXAMPLE 2: Evaluation of expression vectors in stable transfection**

Materials and Methods

Methods:

 Cells: CHO-S, from Gibco/ Invitrogen (Cat no 11619).

 Plasmid DNAs (according to Fig. 2) were isolated from overnight growing
10 standard cultures with the Nucleobond PC 500 kit (Macherey-Nagel Cat. No 740 574)
 according to the protocol provided by the manufacturer.

Transfection:

 Lipofectamine (*Invitrogen, Cat No 18324-012*)

15 For stable transfections, T75 flasks were used. CHO-S in exponential growth
 phase were passaged 24 h before transfection. To avoid a stationary phase at low cell
 density, they were diluted to 0.75×10^6 cells/ml. The total amount of cells to be
 transfected was 5×10^6 , resuspended in 7 ml SFM II medium (Invitrogen Cat no 12052-
 114) in a T75 flask.

20

 Transfection mixes were as follows:

 A) Lipofectamine: 52,1 μ l

 SFM II Medium: 517,9 μ l

 Total volume is 570 μ l.

25

 B) DNAs: 10 μ g linearised plasmid DNA, (9 μ g Luc expression vector + 1 μ g
 plasmid for selection: SV40 promoter driving Puromycine resistance gene. All plasmids
 were linearised with PvuI)

 SFM II Medium was complemented to 570 μ l.

30

 A and B were mixed and incubated for 30 min at room temperature. 7 ml
 containing 5×10^6 cells were added and the cells placed back in an incubator at 37°C
 and 5% CO₂ for 3 hours. Then the culture was centrifuged at 800g for 3 minutes, and the
 cell pellet resuspended in 5 ml EX-CELL 325 (JRH, Cat no 14335-1000M),

supplemented with 1X HT and 4,5 mM L-Glutamine (100X HT, Invitrogen, Cat.no 11067-030, L-Glutamine 200 mM, Sigma, G-7513). 5 ml EX-CELL 325 were added directly to the T75 flask in order to resuspend adhering cells, and added to the suspension. In total, 5×10^6 cells were in 10 ml EX-CELL 325 medium.

5

Selection Procedure:

Selection was applied 48 hours post transfection by exchanging the medium and diluting to 1×10^6 cells / ml in EX-CELL 325 containing 10 μ g/ ml puromycin (Sigma, P-8833). Every two days, cells were counted, centrifuged, and resuspended in fresh selective medium at 1×10^6 living cells / ml. Viability was checked at these points. After 21 to 35 days the selection was completed, and cell viability was higher than 80 %.

10

Luciferase Measurement:

Two hours before sampling the culture, the cells were counted and the culture diluted to 0.2×10^6 living cells/ml.

15

The Bright-Glo Luciferase assay system from Promega, Cat No E2610 was performed according to the manufacturer's guidelines.

Briefly, the cells were suspended by pipetting up and down several times, and an aliquot of 50 μ l was taken out and put in a white 96 well plate (Nunc, Cat no 236108). 50 μ l of reconstituted Bright-Glo Reagent was directly added, and incubated for 5 min at room temperature. Light emission was measured on a Centro LB 960 luminometer (Berthold Technologies) during 5 seconds of acquisition time.

20

Luciferase activity was then normalized by the number of living cells in the sample tested, i.e. typically 1×10^4 cells.

25

Results

Constructs C, D, E and F (see Fig. 2) were tested in a stable expression system. The results are depicted in Fig. 5. Construct E, comprising the IE2 promoter alone, resulted in the strongest expression of luciferase in this system. If present together with the IE1 promoter in bi-directional arrangement (construct D), the IE2 promoter still resulted in luciferase expression that was superior to expression driven by the IE1 promoter, either alone (construct F) or in bi-directional arrangement with the IE2 promoter (construct C).

30

EXAMPLE 3: Co-expression of two polypeptides of interest from bi-directional expression vectors

Materials and Methods:

The transfections were carried out as described in Examples 1 and 2. Briefly,
5 CHO-S cells (in suspension, Gibco SFMII) were transiently transfected with 900, 500,
300 and 100 ng of vector DNA (construct C-2, see Fig. 3) in 24 well plates (triplicates for
each condition). Two days post transfection, luciferase assays were carried out with cell
extracts from the triplicates as expressed by RLU (relative light units). Supernatants from
the same wells were taken before cell lysis, pooled and assayed for IL18BP by Elisa
10 (see below).

IL-18BP ELISA

The amount of recombinant human IL-18BP (rhIL-18BP) in the supernatant was
measured by standard ELISA using a proteinG-purified monoclonal anti-rh-IL-18BP
15 antibody that was coupled to biotin. Extravidine-HRP (Sigma) was used as detection
reagent.

Fig 9 shows the amounts of IL-18 BP in ng/ml and luciferase in RLU expressed
by 48 clones at day 90 after stable transfection with a bi-directional mCMV promoter
20 construct (see Fig.3). The detection limit for luciferase was about 500 RLU, and 2.5
ng/ml for IL-18BP.

Results

In this series of experiments, concomitant expression of two genes from
25 construct C-2, depicted in Fig. 3, was assayed. The marker gene (Luciferase) was
expressed from the IE1 promoter, and the gene of interest, the IL-18BP gene, was
expressed from the IE2 promoter. IL-18BP is a secreted protein. The promoters were
arranged in bi-directional architecture, i.e. both promoters simultaneously drove
expression in opposite directions.

30

The results of this study are depicted in Figs. 6 to 9. Fig. 6 shows the extent of
luciferase expression as expressed by RLU measured in a transient expression system.
In the same transient expression system, IL-18BP was measured by ELISA in the cell

culture supernatants. Fig. 7 shows the results in ng/ml of secreted IL-18BP. Fig. 8 shows the ratios of IL-18BP to Luciferase in each transient expression experiment.

As shown in Figs. 6 to 8, different amounts of plasmid DNA were used for transfection. All amounts of DNA used resulted in expression of both Luciferase and IL-18BP. Surprisingly, the best results were obtained with the lowest amount of DNA transfected, 100 ng of vector DNA, consistently for IL-18BP and luciferase.

Furthermore, the stable quotient (Fig. 8) indicates a constant relationship between the expression potential of both promoters.

In conclusion, these data demonstrate that both genes are simultaneously expressed from the two promoter units, further showing that both expression units are fully functional in the bi-directional promoter architecture.

Then, construct C-2 was stably transfected, and the expression of Luciferase and IL18BP assayed in 48 independent clones.

Stable transfections were carried out according to the protocol described in example 2, with the exception that the medium used after transfection was ProCho5 (Cambrex, cat. 12766Q).

For single cell cloning, the pool was arrayed in 384 well plate (Nunc, cat. 164688) at a density of 0.5 cell per well (70 μ l/well) using a Multidrop dispenser (ThermoLabsystems, cat. 5840150). 8 days later, 192 clones were randomly picked and analyzed for Luciferase expression. 48 clones with highest Luc expression were chosen and re-assayed for both Luciferase (luminometry) and IL18 BP expression (by manual ELISA, see above).

Fig. 9 shows the results of this experiment. All 48 clones expressed Luciferase and IL-18BP, albeit in varying amounts.

EXAMPLE 4: Minimal enhancer sequence definition

Materials and methods

Plasmid DNAs

A set of vectors containing shortened mCMV promoters were built using PCR (Polymerase Chain Reaction) and specific primers matching along the mCMVp (Table 1).

PCR conditions were as follows:

5 Mix:

10 ng DNA plasmid (prevmCMV-Luciferase (ΔXhoI), construct E of Fig. 2)

50 pmol of both sense and antisense primer (see table 1 below, common antisense for all)

200 μM each dNTPs (dATP, dTTP, dGTP, dCTP)

10 1X Dynazyme buffer, containing 1.5 mM MgCl₂

4 units of Dynazyme II DNA polymerase (Finnzymes, cat. F-501S)

Cycling parameters:

95°C, 5'

2 cycles:

15 95°C, 30"

52°C, 30"

72°C, 1'30

2 cycles:

20 95°C, 30"

54°C, 30"

72°C, 1'30

10 cycles:

25 95°C, 30"

58°C, 30"

72°C, 1'30

15 cycles:

30 95°C, 30"

60°C, 30"

72°C, 1'30

5 μl of each PCR reaction was loaded on a 1% agarose gel. Bands having the correct length were cut out and purified using Qiagen Minilute Gel Extraction kit, cat. 28606, prior to cloning.

Table 1

| Position | Primer |
|----------|------------------------------|
| -1076 | CCGCTCGAGACCTTATGTACGTGCCA |
| -783 | CCGCTCGAGCTCCAATGGAACTTTCCTG |
| -587 | CCGCTCGAGACTTTCCTGTTGATTCACC |
| -387 | CCGCTCGAGCAAAACCCAGTGGAAAGTC |

| | |
|----------|-------------------------------|
| -189 | CCGCTCGAGATGCCATATGAGTGTATTAG |
| E1-IE2as | CGGAATTCGATATCCGCCGCTCTC |

The positions corresponding to the number of base pairs kept from mCMVp, considering the +1 from IE2 as reference, are: -1076, -783, -587, -387 and -189

The cloning strategy for any of the promoter fragments was the same, PCRs were carried out on full length mCMVp (prevmCMV-Luciferase (Δ XhoI), i.e. construct E of Fig. 2). The fragments were then digested by XhoI/ EcoRI, two restriction sites added at the extremity of the specific primer sequence. The promoter sequence was then removed from construct E by digesting it by XhoI/EcoRI, and shorter versions were inserted at the very same locus.

The evaluation of the constructs was done by transient Lipofectamine transfection followed by Luciferase measurement. Further materials and methods were as described in Example 1. The SFM medium used in this example was ProCho5, Cambrex, B-12766Q.

Results

Vectors H to N (Fig. 10.a) comprising the mCMV IE2 promoter driving the Luciferase gene were constructed in order to define minimal sequences required for high expression levels from the IE2 promoter.

The seven expression vector constructs H to N were used in a CHO-S cell based transient expression system. The results are depicted in Figure 10.b). Construct L is the shortest construct retaining strong expression of Luciferase in this system. Construct M still resulted in Luciferase expression the level of which was about 30% of the expression level reached with constructs H to L. Luciferase expression obtained with construct N was very low but still significant, indicative of basal promoter activity as expected for a productive transcription start site containing a TATA box and initiator.

In conclusion, these experiments define a new enhancer in the mCMV IE2 upstream region, herein called mCMV IE2 enhancer. In the above experiments, the IE2 enhancer increases transcription from the minimal IE2 promoter retained in construct N. The minimal sequence required for high reporter gene expression is within the -587 to -

189 bp fragment (construct L), and a construct comprising the -387 to -189 bp fragment still enhanced Luciferase expression (construct M).

EXAMPLE 5: The new IE2 enhancer activates a SV40 minimal promoter

5 Further experiments were carried out in order to assess whether the new IE2 enhancer indeed fulfills all criteria required for enhancer activity, i.e. enhancing expression independently from (1) location, (2) orientation, and (3) promoter identity. In order to do so, constructs O to V were constructed in order to assess that the new IE2 enhancer could enhance expression of a heterologous promoter, the SV40 promoter,
10 independently of the orientation, distance and position (5' or 3'), relative to the SV40 promoter. Constructs W, X and Y were the controls, W containing the SV40 enhancer, X not containing any enhancer, but the SV40 promoter, and Y containing neither an enhancer nor a promoter.

15 *Vector construction*

A vector called pSV-Luc (construct X of Figure 11(a)) which contains only the SV40 promoter was constructed from pGL3-Ctrl (Promega, E 1741), containing SV40 promoter driving Luciferase gene, and SV40 enhancer located in 3' of the gene (construct W), and pGL3-Basic (Promega, E1751), lacking both promoter and enhancer
20 (construct Y).

Briefly, pGL3-ctrl was cut with NotI/XbaI to isolate a fragment containing the SV40 promoter, followed by the Luciferase gene. In a similar way, pGL3-basic was cut with NotI/ XbaI and the vector backbone containing the poly A region was isolated, without the 3' enhancer. By combining the two fragments, pSV-Luc (construct X) was
25 obtained.

The region 5' of the SV40 promoter of this vector was engineered by cloning the IE2 enhancer sequence (-587 to -189) in both orientations, called p5'enh-SV-Luc (construct O), and p5' reverse enh-SV.Luc (construct Q). Furthermore, the IE2 enhancer sequence (-587 to -189) was also cloned into the 3' region of the Luciferase gene, in
30 both orientations. Resulting vectors were called p3'enh-SV-Luc+ (construct S), and p3' reverseenh-SV.Luc. (construct U),

The same procedure was carried out with the short version of the IE2 enhancer, i.e. having -387 to -189 instead of -587 to -189, and were called constructs P, R, T and V, see Fig. 11.a.

Construct O, P: Recipient vector was pSV-Luc+ (construct X of Fig11.a) opened by digestion with NheI/SmaI. The full-length enhancer was isolated by a digestion with NdeI, followed by blunt-ending reaction using Klenow polymerase, purification and digestion by NheI. The same strategy was applied for construction of the short enhancer construct.

Construct Q, R: Recipient vector was pSV-Luc+ (construct X of Fig11.a) opened by digestion with XhoI/SmaI. The full-length enhancer was isolated by a digestion with NdeI, followed by blunt-ending reaction using klenow polymerase, purification and digestion by XhoI. The same strategy was applied for construction of the short enhancer construct.

Construct S, T, U and V: Recipient vector is pSV-Luc+ (construct X of Fig. 11.a) opened by digestion with BamHI, followed by blunt ending using Klenow polymerase. The full-length enhancer was isolated by a digestion with NdeI/NheI, followed by blunt-ending reaction using Klenow polymerase. Cloning allowed both orientations which was identified by restriction analysis. Both orientations were kept for analysis. The same strategy was applied for construction of the short enhancer construct.

Constructs pGL3-Basic (construct Y) served as no expression control. pGL3-ctrl (construct W) served as SV40 promoter/enhancer vector. pSV-Luc was the control having the SV40 promoter alone (construct X).

Transfections and Luciferase measurements were carried out as in the previous examples.

Results

The results obtained with constructs O to Y of Fig. 11.a are depicted in Fig. 11.b. The enhancer-less SV40 promoter construct was taken as a baseline for added enhancer activity, and the activity measured with construct X was set as 1. All constructs having either the long or the short IE2 enhancer resulted in expression of the reporter gene. The long version consistently resulted in high expression of the reporter gene from the SV40 promoter, which was much higher than the expression level obtained with the combination of the SV40 promoter and SV40 enhancer (construct O). Therefore, this experiment clearly defines the -587 to -189 sequence and the -387 to -189 sequence as bona fide enhancers, activating a heterologous promoter in a position- and orientation independent manner.

EXAMPLE 6: comparison between the long IE2 enhancer version (-537 to -169) and the hCMV enhancer

Experimental protocols for transfection with Lipofectamine, followed by Luciferase measurement, are described in Example 1.

5

Results

In this experiment, constructs O and Q, having the long version of the new IE2 enhancer in both orientations in 5' of the SV40 promoter, were used for comparison to a known strong enhancer, the hCMV (human cytomegalovirus) enhancer. To this end, the mCMV IE2 sequence was replaced by the hCMV enhancer sequence (SEQ ID NO: 2) in construct O, resulting in construct O-2. The same was done in construct Q, resulting in construct Q-2.

The hCMV enhancer sequence having MluI sites (MluI=acgcgt) flanking it, which were used for cloning, was as follows:

SV-Luc+ was digested with MluI, and treated by Calf Intestine Alkaline Phosphatase to prevent self ligation. The hCMV promoter sequence was cloned in MluI site. Both orientation clones were kept for comparison with equivalent IE2 constructs.

30

Results of Luciferase expression are shown in Fig. 12. The Luciferase expression level obtained with the new IE2 enhancer (long version) were at least twice as high as the Luciferase expression levels obtained with the classical hCMV enhancer.

35

EXAMPLE 7: IE2 enhancer performance in a bi-directional construct

Two further constructs were designed to test the new enhancer in a bi-directional architecture, called constructs #26 and #140 as depicted in Fig. 13.

5 #26: The basis of this vector was mCMV-Luc+(construct C, Fig 3). It was digested with SacII/EcoRI. The IL-18BP cassette was taken from phCMV-IL18BP2. By cutting this vector with SacII/EcoRI, a fragment containing the Intron A followed by IL-18BP open reading frame and the SV40polyA region was isolated.

10 #140. The basis of this vector was construct L of Fig 10.a. It was digested with XhoI/NheI, opening the vector 5' of the IE2 enhancer. A vector expressing IL18BP from IE1promoter, called pBS.I IL18BP(IE1).I, was used as insert donor. By digesting this vector with XhoI/SpeI, a fragment was isolated containing the IE1 promoter from XhoI (see Fig 1) followed by the IntronA-IL18BP-SV40polyA cassette. The resulting construct lacked the sequence between -589 to XhoI of the original mCMV promoter sequence.

15 Stable transfections and Luciferase measurement were carried out as described in example 2, and the IL18BP ELISA as described in example 3.

20 However, construct #140 does not exactly mirror construct #26 in that the IE1 and IE2 promoters are in reverse orientation. Thus, Luciferase expression was driven by the IE1 promoter in construct #26, but by the IE2 promoter in construct #140, and IL18BP expression was driven by the IE2 promoter in construct #26 and by the IE1 promoter in construct #140.

The results obtained with both constructs are shown below, since they are significant for the simultaneous effect of the new IE2 enhancer on two different promoters in a bi-directional expression vector (construct #140).

25 Fig. 14 depicts the results from pools stably transfected with construct #26 and #140 in terms of Luciferase and IL-18BP expression. Construct #140 resulted in higher expression of both marker gene (Luciferase) and gene of interest (IL-18BP).

30 In order to assess stability of expression of Luciferase and IL-18BP, the pools were either kept under selective conditions, i.e. under puromycin treatment, or were kept without selective pressure (without puromycin) for three weeks. The results are shown in Figs. 15 to 17. The expression levels of the reporter gene Luciferase and the IL-18BP did not significantly change over time, see Fig. 16 and 17.

Thus, it was demonstrated that both constructs #26 and #140 showed similar expression levels over time, in presence or absence of selection pressure. Therefore,

constructs having the new IE2 enhancer are suitable for stable and simultaneous expression of two genes.

As the above results were obtained in pools, clones were derived by limiting dilution at 0.5 cells well from both pools.

5 Clones were cultivated under puromycin selection, in order to evaluate clonal expression levels. Then, the isolated clones were split in presence and absence of puromycin to eventually monitor their stability. The results presented in Figs.18 and 19 were taken before the clones were split in +/- puromycin conditions. Results from 2 weeks after removal of puromycin showed no significant difference for both constructs, thus suggesting stability. This study will be continued for another 10-12 weeks.

10 In order to evaluate expression of both genes a high throughput format was used, namely in 96 well plates:

Day 1: Dilution 1/2 of the cells, 100 µl of ProCho5 culture medium (serum free) + 100 µl of fresh ProCho5 containing 5 % Fetal Bovine Serum. With 2.5 % FBS final concentration, cells were able to attach. Weekly passage of the maintenance plate was done in a 1/20 dilution factor, all in ProCho5 medium.

Day 2: Medium was discarded, washed once with 200 µl 1x PBS (Invitrogen, 10010-015), and 75 µl fresh ProCho5 containing 5% FBS added, and incubated for a 24 h expression pulse.

20 Day 3: 50 µl of the supernatants were recovered, and 200 µl Elisa buffer added (1x PBS, 0.1 % w/v BSA, 0.2 % v/v Tween 20). 100 µl were analyzed by ELISA for IL-18BP.

The wells were washed with 200 µl 1x PBS (discard) and 100 µl Glo Lysis buffer (Promega, E266a) were added. The wells were incubated for 30 min at room temperature to ensure cell lysis. Luciferase measurement was done using 30 µl lysed cells transferred in a white 96 well plate + 30 µl reconstituted Bright-Glo reagent. Light emission was measured on a Centro LB960 luminometer during 5 seconds acquisition time.

25 The analyses of the clones obtained from stable transfections with construct #26 are depicted in Fig. 18, and the ones resulting from stable transfection with construct #140 in Fig. 19.

30 The clones depicted in Figs. 18 and 19 were ranked by their Luciferase value in a descending manner. IL18BP expression was indicated as OD value. Since the Elisa was

carried out in high throughput format, real quantification of the IL-18BP levels could not be obtained. However, controls at 2500 ng/ml and 250 ng/ml as well as blank were included to monitor plate to plate variation.

Fig. 20 shows luciferase expression on the plates in inverted ChemiDoc view.

- 5 This view uses a a CCD camera (Biorad), allowing to acquire signals coming from chemiluminescence (as in Fig.20). A Software called Quantity One 4.2.3 allows picture management like inverting the signals, which was employed here.

- 10 As evident from the results shown in Figs. 18 to 20, construct #140 resulted in a lot of non-expressing clones. However, surprisingly, the few positive clones expressed both genes extremely strongly.

Therefore, construct #140 allows screening for very high expressors in very early cloning phases, thus omitting the necessity to test and follow-up on high numbers of clones in order to identify the few clones that highly express both genes of interest.

CLAIMS

1. An expression vector comprising the promoter of the mCMV-IE2 gene, or a functional expression promoting fragment thereof, and/or an enhancer of the mCMV-IE2 gene, or a functional expression enhancing fragment thereof, wherein the expression vector does not contain any complete gene of the mCMV.
2. The vector of claim 1, further comprising a promoter different from the mCMV-IE2 promoter, or a functional expression promoting fragment thereof.
3. The vector according to claims 1 or 2, comprising a first and a second promoter of viral, cellular or artificial origin, or functional expression promoting fragments thereof.
4. The vector of claim 3, wherein the first promoter is the mCMV-IE2 promoter, or a functional expression promoting fragment thereof, and the second promoter is the mCMV-IE1 promoter, or a functional expression promoting fragment thereof.
5. The vector according to any of the preceding claims, comprising the DNA sequence of SEQ ID NO: 1.
6. The vector according to any of the preceding claims, comprising a fragment including nucleotides -387 to -189 of the mCMV IE2 upstream region, the nucleotide numbering being relative to +1 of the IE2 gene.
7. The vector according to any of the preceding claims, comprising a fragment including nucleotides -587 to -189 of the mCMV IE2 upstream region, the nucleotide numbering being relative to +1 of the IE2 gene.
8. The vector according to any of the preceding claims, wherein the promoter, or the functional expression promoting fragment thereof, is operably linked to a DNA sequence coding for at least one polypeptide.
9. The vector according to claim 8, wherein the DNA sequence codes for a protein of interest.
10. The vector according to claim 8, wherein the DNA sequence codes for a marker protein.
11. The vector according to claim 8, wherein the DNA sequence codes for a reporter protein.
12. The vector according to any of claims 3 to 11, wherein the first promoter, or functional expression promoting fragment thereof, and the second promoter, or functional expression promoting fragment thereof, are bi-directionally arranged.

13. The vector according to any of the preceding claims, further comprising one or more regulatory elements selected from 5'UTRs, introns, 3'UTRs, mRNA 3' end processing sequences, polyadenylation sites, and internal ribosome entry sequences (IRES).
- 5 14. The vector according to claim 13, wherein the regulatory element is an IRES, further comprising a DNA sequence coding for at least one polycistronic mRNA.
15. The vector according to any of the preceding claims, further comprising one or more DNA elements selected from insulators, boundary elements, locus control regions (LCRs), matrix attachment regions (MARs), and elements for recombination and cassette exchange .
- 10 16. The vector according to any of claims 8 to 15, wherein the DNA sequence coding for the polypeptide operably linked to the first promoter and the DNA sequence coding for the polypeptide operably linked to the second promoter code for the same polypeptide.
- 15 17. The vector according to any of claims 8 to 15, wherein the DNA sequence coding for the polypeptide operably linked to the first promoter and the DNA sequence coding for the polypeptide operably linked to the second promoter code for different polypeptides.
- 20 18. The vector according to claim 17, wherein the DNA sequence coding for the polypeptide operably linked to the first promoter codes for a first subunit of a dimeric or multimeric protein and the DNA sequence coding for the polypeptide operably linked to the second promoter codes for a second subunit of a dimeric or multimeric protein.
- 25 19. The vector according to claim 18, wherein one subunit is the alpha chain and the other subunit is the beta chain of a hormone selected from human FSH, human LH, human TSH and human CG.
- 20 20. The vector according to claim 18, wherein one subunit is the heavy chain and the other subunit is the light chain of an immunoglobulin.
- 30 21. The vector according to any of claims 9 to 20, wherein the protein of interest is selected from FSH, LH, CG, TSH, growth hormone, interferon, TNF binding protein I, TNF binding protein II, Raptiva®, IL-18BP, or muteins, fragments, functional derivatives, fusion proteins thereof.
22. The vector according to any of claims 10 to 21, wherein the marker protein is selected from adenosine deaminase (ADA), aminoglycoside phosphotransferase

- (neo), dihydrofolate reductase (DHFR), hygromycin-B-phosphotransferase (HPH), thymidine kinase (tk), xanthine-guanine phosphoribosyltransferase (gpt), multiple drug resistance gene (MDR), ornithine decarboxylase (ODC) and N-(phosphonacetyl)-L-aspartate resistance (CAD), puromycin acetyltransferase (PAC), galactokinase, human folate receptor, or reduced folate carriers.
23. The vector according to claims 11 to 22, wherein the reporter protein is selected from luciferase, green fluorescent protein, alkaline phosphates, and horseradish peroxidase or combinations thereof.
24. A host cell transfected with a vector according to any of the preceding claims.
25. The host cell according to claim 24, wherein the host cell is a CHO cell.
26. A process for the production of a polypeptide comprising the step of transfecting a host cell with at least one vector according to any one of claims 1 to 23.
27. The process according to claim 26, wherein the transfection is stable transfection.
28. A process for the production of a polypeptide comprising the step of culturing a host cell according to claim 24 or 25 under conditions allowing expression of the polypeptide.
29. The process according to claim 26 or 27, further comprising the step of isolating the polypeptide from the host cell or cell culture supernatant.
30. Use of a vector according to any of claims 1 to 23 for expression of a gene of interest.
31. Use of a vector according to any of claims 1 to 23 for selection of clones that express high amounts of a gene of interest.
32. Use of a vector according to any of claims 3 to 23 for simultaneous expression of two or more genes or DNAs of interest.
33. Use of a vector according to any of the preceding claims for the manufacture of a medicament for DNA-based therapy.
34. Use of a host cell according to claim 24 or 25 for the manufacture of a medicament for cell-based therapy.
